Power Electronics Testings LED Power Driver Test Solution

A Light Emitting Diode (LED), with low power consumption, compact size, long life duration and versatility, is ideal for lighting and illumination applications. LEDs have found its applications in LCD monitor/TV backlights, street lighting, automobile lighting, interior lighting, outdoors large screen displays, consumer electronics and various other applications.

LED power drivers are used to provide the power to the LEDs, and are usually designed as a constant current source due to the light emitting characteristics of the LEDs. Although LED power drivers' functions and characteristics differ from the general switch mode power supply (SMPS), the components used, the design topology and the testing requirements are very similar. Chroma is able to provide LED testing solution based on its thirty years of experience in providing power electronics testing solutions. These solutions include : programmable AC and DC Sources, high precision Power Meters, and LED Load Simulator specifically designed for LED power drivers. Chroma is also able to provide Automated Test Systems suitable for R&D, QA qualifications and mass production.

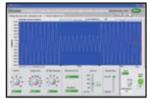

Advance Programmable AC Power Sources

Model 61500 Series

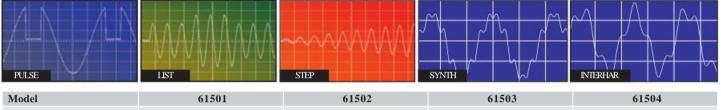

Key Features

- ☑ Output : 500VA~4kVA/0~300VAC/424VDC
- ☑ AC, DC, AC+DC output mode
- ☑ Turn-on, turn-off phase angle control
- \blacksquare Programmable voltage and frequency slew rate
- ☑ Power line disturbance simulation : LIST, PULSE, STEP modes
- ☑ Distortion waveform editor : SYNTH and INTERHAR modes
- Measurement for RMS voltage, current, power, PF, VA, VAR, crest factor, peak and inrush current
- ☑ Standard AC source for IEC61000-3-2 testing
- ☑ IEC 61000-4-11, -4-13, -4-14, -4-28 regulation testing

Ideal for Energy Star & High Precision Power Measurement

Digital Power Meters

Model 66200 Series

Key Features

- ✓ Embedded high speed DSP, 16 bits Analog / Digital converters ✓ 5mA minimum current range(66203/66204) and 0.1mW power
- resolution Meets ENERGY STAR / IEC 62301 / ErP ecodesign / SPEC
- POWER measurement requirement
- Accumulated energy methods for unstable power measurement
- User-defined criteria provides automatic PASS/FAIL indications
- ☑ Optional remote interface: USB or GPIB+USB
- ☑ Support GPIB, USB, RS232, Ethernet (LXI) interface (66205)

LED Load Simulator

Model 63110A / 63113A / 63115A

Key Features

- ☑ Unique LED mode for LED power driver test
- ☑ Programmable LED dynamic resistance (Rd)
- ☑ Programmable internal resistance (Rr) for simulating LED ripple current (63110A)
- ☑ Fast response for PWM dimming test
- \blacksquare Up to eight channels in one mainframe
- ☑ 16-bit precision voltage and current measurement with dual-range
- ☑ Full Protection: OC, OP, OT protection and OV alarm

As a constant current source, the LED power driver has an output voltage range with a constant output current. LED power drivers are usually tested in one of the following ways; 1. With LEDs

2. Using resistors for loading

3. Using Electronic Loads in Constant Resistance (CR) mode, or Constant Voltage (CV) mode However, all these testing methods each have their own disadvantages.

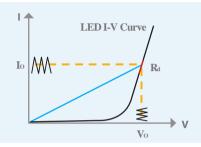

Figure 1 - LED V-I Characteristics

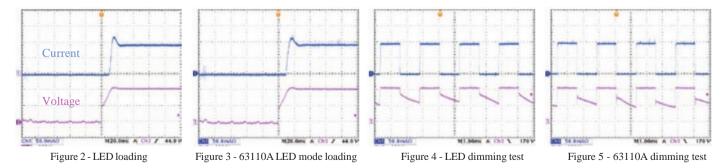

As shown on the I-V curve in figure 1, the LED has a forward voltage V_F and a operating resistance (R_d). When using a resistor as loading, the I-V curve of the resistor is not able to simulate the I-V curve of the LED as shown in blue on figure 1. This may cause the LED power driver to not start up due to the difference in I-V characteristic between the resistors and the LEDs. When using Electronic Loads, the CR and CV mode settings are set for when the LED is under stable operation and therefore, is unable to simulate turn on or PWM brightness control characteristics. This may cause the LED power driver to function improperly or trigger it's protection circuits. These testing requirements can be achieved when using a LEDs as a load; however, issues regarding the LED aging as well as different LED power drivers may require different types of LEDs or a number of LEDs. This makes it inconvenient for mass production testing.

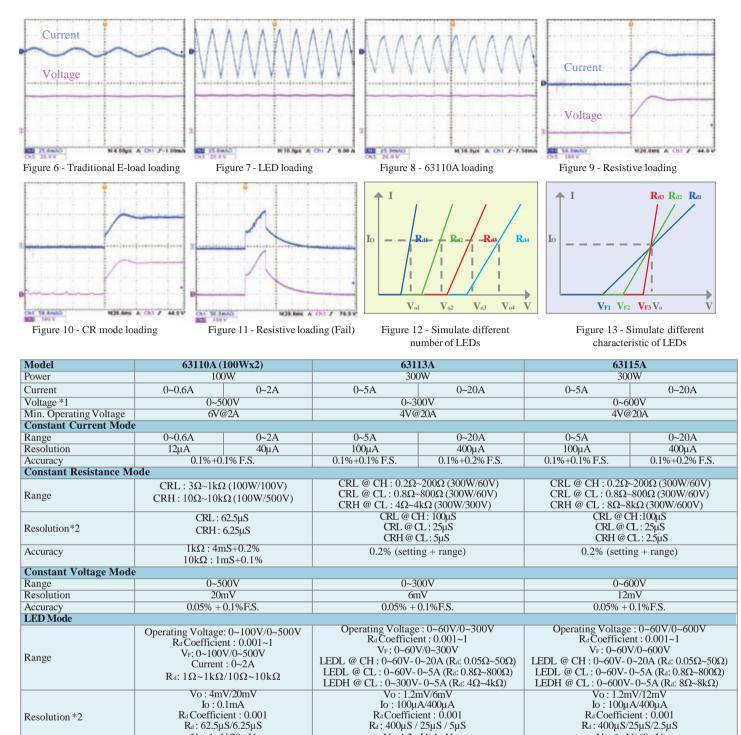

Mainframe Model	6312A (2 slots)	6314A (4 slots)
Dimensions	194×275×550 mm /	194×439×550 mm /
$(\mathbf{H} \times \mathbf{W} \times \mathbf{D})$	7.6×10.8×21.7 inch	7.6×17.3×21.7 inch
Weight	15 kg / 33.1 lbs	21.5 kg / 47.4 lbs

Chroma has created the industries first LED Load Simulator for simulating LED loading with our 63110A load model from 6310A series Electronic Loads. By setting the LED power driver's output voltage, and current, the Electronic Load can simulate the LED's loading characteristics. The LED's forward voltage and operating resistance can also be set to further adjust the loading current and ripple current to better simulate LED characteristics. The 63110A design also has increased bandwidth to allow for PWM dimming testing.

Figure 2 shows the current waveform from a LED load. Figure 3 shows the current waveform from 63110A's LED mode load function. From figures 2 and 3, the start up voltage and current of the LED power driver is very similar. Figure 4 shows the dimming current waveform of the LED. Figure 5 shows the dimming current waveform when using 63110A as a load.

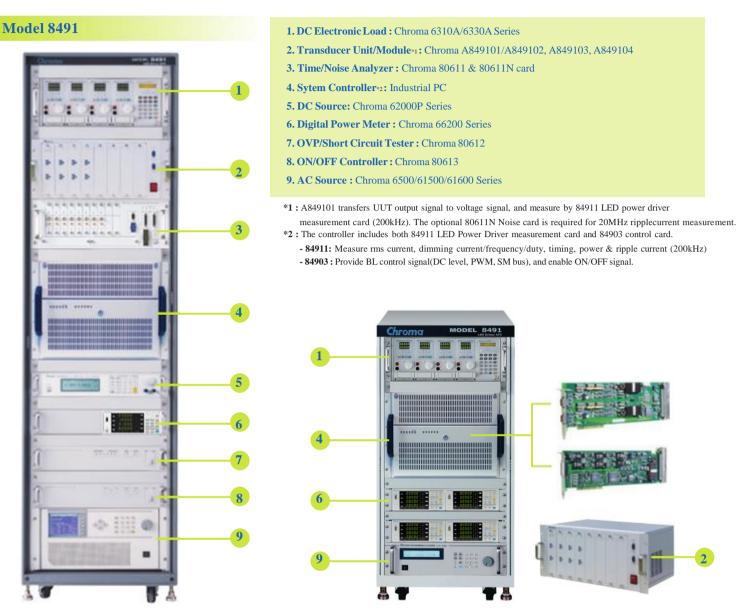

The internal resistance (Rr) can be adjusted to simulate the LED power driver output ripple current. The traditional E-load can not simulate the ripple current of LED shown as figure 6. Figure 7 shows the ripple current waveform from a LED load. Figure 8 shows the ripple current waveform from the 63110A LED mode load function. Figure 9 and 10 show the turn-on waveform of using a resistive load and an electronic load. It is obvious that these waveforms are very much different from the one with real LED (Figure 2). And it may cause the LED power drivers to fail as shown in figure 11, which causes it to go into protection. Figure 12 shows the I-V curve of different numbers of LEDs, and figure 13 shows the I-V curve of different characteristics of LEDs those can simulated by 63110A/63113A.

NOTE*1: If the operating voltage exceeds 1.1 times of the rated voltage, it would cause permanent damage to the device. vice. NOTE*2 : S (siemens) is the SI unit of conductance, equal to one reciprocal ohm.

High Performance Hardware Devices and Software Architecture LED Power Driver Automatic Test Systems

The 8491 ATS hardware can be customized according tousers (R/D, QC, Production Line) or according to different testing requirements. (Eg. lighting)

Optimized Test Items

The Chroma 8491 ATS is equipped with optimized standard test items for LED lighting driver testing. The user is only required to define the test conditions and specifications for the standard test items to perform the test.

The optimized test items cover 6 types of power supply test requirements. OUTPUT PERFORMANCES verify the output characteristics of the UUT. INPUT CHARACTERISTICS check the UUT input parameters. REGULATIONS test the stability of UUT under varying line-in and loading changes. TIMING & TRANSIENT test the timing and transient states during protection. PROTECTION TESTS trigger and test the protection circuit, the SPECIAL TESTS provide means to test the most sophisticated UUT when unique test routines are needed.

Output Performances

- 1. Output voltage
- 2. Output current
- 3. Ripple Current (RMS & p-p)
- 4. Dimming Current
- 5. Dimming Frequency
- 6. Dimming Duty
- 7. Efficiency
- 8. In-test adjustment
- 9. Turn on over shoot current

Special Tests

31. GPIB Read/Write 32. RS232 Read/Write

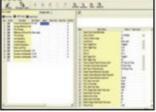

Software Platform of ATS

The Model 8491 Test System includes the industries most sophisticated power supply testing software platform, PowerPro III. PowerPro III provides users an open software architecture suited for a wide range of applications and devices. PowerPro III runs under the user friendly Windows 98/2000/NT/XP/7 operating environment, which provides engineers a dedicated LED Power Driver test system with easy access to Windows resources.
