It is a general requirement to record temperatures, voltages, currents, and many physics quantities during research, product development, productions, and quality assurance processes. The number of record channels can be a simple one to several complicated set of hundreds. Thermal/multi-function data loggers are perfect solutions to serve for these measurement and tracking needs.

There are several measurement products in the market to perform such a large-scale and extensive time varying recording. Some are expensive, some are limited in accuracy or resolution, and some have low immunity to interference. Chroma thermal/multi-function data loggers are by far the most cost-effective solutions for versatility, accuracy, stability, and interference immunity among this category.

Chroma thermal/multi-function data loggers measure temperatures, voltages, and currents with high accuracy and resolutions. For example, they support 8 types of thermal couples measurement with ITS-90 defined temperature range at 0.5°C accuracy and 0.01°C resolution*, while most data loggers in the market are at 1°C accuracy and 0.1°C resolution*. Chroma loggers are with 1000VDC channel to channel isolation, which means they can attach thermal couples to objects with high electricity, such as batteries, solar cells, working PCB, etc., and still get correct data. Many competitors are just malfunctioned or even damaged in those cases. Data retrieve in Chroma loggers are in a parallel architecture, while most of competitors use a sequential multiplexing method. This means data rate per channel is quick and constant for Chroma loggers, while others become much slower when number of channels is bigger.

Using Chroma thermal/multi-function data loggers, customers get confidence in measured data and high Performance/Cost ratio. Most of all, we can help in certain cases that our competitors fail, and only Chroma succeeds.

*Thermal couple error excluded. Please see specification list for detail.
For the same or even lower prices, Chroma thermal/multi-function data logger offers higher accuracy and better resolution than our competitors do. While most of data loggers are at 1˚C accuracy and 0.1˚C resolution, Chroma data loggers are 1 order better than theirs. It is always true the more accurate and seeing more details, the better for measurements.

In order to achieve such high accuracy and resolution, Chroma implements individual CJC for each channel. High bit-count A-to-D converters and advanced noise suppression circuit makes outstanding performance for these data loggers. The best of all is that customers can enjoy better specifications without paying more.

Precise temperatures can be critical in thermal conductivity measurements, chemical processes, and biologic experiments. Testing a heat pipe, for example, often requires resolving <1˚C temperature difference between evaporation and condensing zones. Some liquid crystals can change their properties drastically with a very small temperature variation at critical temperatures.

In developing or qualifying some electronic devices, tracking records of temperatures/voltages/currents are required. Many cases there can be high voltage difference between measured points. A switching power supply, for example, is required to measure the primary side voltage/current, secondary side voltage/current, and key component temperatures. Unfortunately, many data loggers including some leading brands are incapable to handle such a high voltage difference between both sides. Few hundred voltage difference can mess up their measurement totally, or even kills their loggers.

Chroma thermal/multifunction data loggers are perfect for the measurements in a situation with charge and high voltage difference. The feature of 1000VDC channel to channel isolation makes them immune to voltage difference between any two channels. One just attaches thermal couples or wires on the device or conducting pads and gets accurate data.

Another case can be battery system tests. One needs to know the voltage and temperature of each cell. For other data loggers, often the voltages cannot be measured properly in the cascade configuration. The thermal couple attachment is another issue needing special care. All these problems are easily solved using Chroma thermal/multi-function data loggers for the high channel to channel isolation.

**0.5˚C ACCURACY AND 0.01˚C RESOLUTION**

For the same or even lower prices, Chroma thermal/multi-function data logger offers higher accuracy and better resolution than our competitors do. While most of data loggers are at 1˚C accuracy and 0.1˚C resolution, Chroma data loggers are 1 order better than theirs. It is always true the more accurate and seeing more details, the better for measurements.

In order to achieve such high accuracy and resolution, Chroma implements individual CJC for each channel. High bit-count A-to-D converters and advanced noise suppression circuit makes outstanding performance for these data loggers. The best of all is that customers can enjoy better specifications without paying more.

Precise temperatures can be critical in thermal conductivity measurements, chemical processes, and biologic experiments. Testing a heat pipe, for example, often requires resolving <1˚C temperature difference between evaporation and condensing zones. Some liquid crystals can change their properties drastically with a very small temperature variation at critical temperatures.

**CONSTANT DATA RATE PER CHANNEL**

Most of data loggers in the market use a multiplexing circuit structure. All channels share a bandwidth which means the more active channels, the slower data rate per channel will be. Chroma data loggers use a parallel data retrieving circuit structure. No matter how many channels are active, the data rate can be as fast as 5 samples per second per channel.

The benefit of constant data rate can be profound for recording large number of channels. For tens of channels, total data bandwidth of Chroma data logger can be several times larger than that of other data loggers. Some other data loggers can become too slow and lose details. They can miss recording critical changes happen in a short time. Chroma data loggers greatly reduce this possibility.
Personal computers and Notebooks are powerful for their fast calculation and data processing capability, friendly graphic user interface, and huge hard disk storage. While operation of many other data loggers are limited by their small display and memory, Chroma data loggers link to PCs or Notebooks for direct display, analyses, and storage.

Using the PC software, one can see the detail of all the curves, change drawing time and range scales, create marks, zoom in selected sections, and perform difference calculations, all in few simple steps. The PC RAM is used as buffer to store every data since the logger is powered on, making data tracking back possible without opening the record file. Size of data recording is determined by hard disk free space, which is almost unlimited.

### APPLICATIONS

- Automotive & Aircraft
- Electrical & Electronics
- Solar Energy
- Power
- Machinery
- Iron & Steel
- Metals & Mining
- Oil &Gas
- Water & Waste
- Chemical
- Pharmaceutical & Food
- Others

**SPECIFICATIONS**

### Digital I/O
- **Number of Digital I/O**: 4 differential digital inputs and outputs
- **Digital Input**: 1 trigger input (DI0) and 3 general purpose inputs
- **Digital Input - High Input Voltage**: 3 ~ 30 V
- **Digital Input - Low Input Voltage**: < 0.8 V
- **Digital Input - High Input Current**: 0.8 ~ 13.1 mA
- **Digital Input - Low Input Current**: < 10 μA
- **Digital Input - Terminal Resistor**: 2.2K
- **Digital Output Configuration**: transistor switch
- **Digital Output - External Supply Voltage**: < 30 V
- **Digital Output - ON-state Voltage**: < 1.5 V
- **Digital Output - ON-state Current**: < 400 mA
- **Digital Output - OFF-state Current**: < 2.1 mA
- **Digital Output - Power Dissipation per Output**: < 0.6 W

### Communication
- **RS-232**: Half Duplex, DB-9 female connector
- **USB**: USB2.0 (full speed device) ; USB B-type connector
- **LAN**: 10/100 Mbps

### Power Specifications
- **Power Requirement**: 4.5~5.5 V
- **Maximum Power Consumption**: 11.4~12.6 V
- **Digital Input - Terminal Resistor**: 2.2K

### Physical Specifications
- **Dimensions (WxDxH)**: 135.3 x 186 x 51.7 mm
- **Weight for Main Frame**: 1.2 Kg
- **Weight per Sensor Card**: 0.15 Kg
- **Weight (Main Frame + 8 Sensor Card)**: 3.6 Kg

### Environmental Specifications
- **Operating Temperature**: 0~50˚C
- **Humidity**: < 80 %RH
- **Power Adaptor Input Voltage**: 90 to 260 VAC
- **Power Adaptor Input Frequency**: 47 to 63 Hz
- **Main Frame DC Input**: 12.6 V/1.5 A
- **Thermocouple Differential Input Voltage Limit**: ± 1.2 V
- **Operating Temperature**: 0~50˚C
- **Storage Temperature**: -20~60˚C
- **Storage Humidity**: 80 %RH

### Voltage Reading
- **Voltage Input Type**: VA-480 Voltage Adaptor
- **Voltage Resolution**: 1mV
- **Voltage Input Range**: ± 480VDC
- **Voltage Input Accuracy**: ±(0.1% of reading + 1mV)*3
- **Input Resistance**: 1MΩ

### Current Reading
- **Current Input Type**: IA-3 Current Adaptor
- **Current Resolution**: 1mA
- **Current Input Range**: ± 3A
- **Current Input Accuracy**: ±(1% of reading + 1mA)

Note *1*: Measure after heat equilibrium is reached and the uncertainty of thermocouple itself is excluded. Operating temperature within 20˚C to 30˚C range.

Note *2*: For operating temperature out of range from 20˚C to 30˚C, additional error ± [0.01% of reading + 0.03˚C x (T-25˚C)] will be added. T is the ambient temperature.

Note *3*: Under MV_8 filtering mode

Note *4*: Model 51101-64 with LAN module
